of this co-pack

Gabazolamine-0.5™ Convenience Pack

Alprazolam - Why is this medication prescribed?

Alprazolam is used to treat anxiety and panic disorders. It belongs to a class of medications called benzodiazepines which act on the brain and nerves (central nervous system) to produce a calming effect. It works by enhancing the effects of a certain natural chemical in the body (GABA). Alprazolam is used to treat anxiety, panic disorder, repeated episodes of anxiety and anxiousness associated with depression. This medication is also used for abnormal trouble sleeping and involuntary quivering.

GABAdone™ - Why is this medication prescribed?

GABAdone is a Medical Food product that provides the amino acids that are precursors to the neurotransmitters that are associated with the induction and maintenance of sleep. This Medical Food stimulates the body to produce the neurotransmitters that induce sleep, promote restorative sleep, and reduce snoring. Patients with sleep disorders frequently have increased nutritional requirements for tryptophan and choline. Patients with sleep disorders frequently show reduced blood levels of serotonin and 5-hydroxytryptophan. Choline deficiency has also been associated with sleep disorders, particularly those associated with sleep apnea syndromes.

GABAdone aids in the nutritional management of serotonin, acetylcholine and GABA requirements in patients with sleep disorders and sleep disorders associated with anxiety.
